

Clesana C1 – introducing the first waterless mobile toilet with sanitary bag system. Made for camping enthusiasts who value their freedom ... and love our nature.

When we at Clesana call the C1 a defining solution for sanitary needs in caravanning, we really mean it: because not only are we convinced that our mobile toilet solution will define a more sustainable future for the caravanning sector. We also believe in redefining the way camping enthusiasts perceive the world – with more independence, great comfort and a good conscience. In short: the C1 definitely is a game changer.

Go ahead. Go anywhere.

The desire for more spontaneity and individuality is what unites most caravanning enthusiasts. But with the enduring dependence on supply stations and designated camping sites this desire mostly remains wishful thinking. That is why with the development of the C1 toilet Clesana chose a path unbeaten, to enable campers to do the very same. As our groundbreaking toilet system operates water-free and without any need for sanitary tanks we now can sincerely encourage travelers: go wherever you want to go... and stay, wherever you want to stay.

With medical momentum

The revolutionary principle defining the C1 is a product of medical engineering. Designed initially within a project of the Swiss Federal Office of Environment aimed at protecting our waters from contaminations with medicinal residues, hormones and other chemicals, the Clesana system is already in use in hospitals today. Driven by this innovative momentum, all technical components were subsequently modified to meet the sanitary needs in the caravanning sector. The main innovation lies in the application of thermal welding technologies: excretions and toilet waste are sealed securely in foil bags and automatically binned completely odor-free. The stored waste bags can be discarded anywhere as simple house waste.

Clean and simple: the purest form of protection

Creating an environmentally sustainable toilet solution without compromising on hygiene standards was the main objective while creating the C1. Consequently, Clesana not only aids saving large amounts of water, but also does without any sanitary additives. An independent study has already proven the superiority of the C1 in comparison to conventional chemical toilets, throughout all ecologically relevant categories. And just as reliably the C1 protects our waters and soils it also protects users from any unpleasant contact with faeces and toilet wastes.

A perfect fit. For tailor-made ideas.

With the C1 Clesana enforces a new principle in mobile hygiene: go anyplace, place anywhere. As a replacement for cassette toilets the C1 can be easily installed right at the factory without any changes to the vehicle's constructive framework, with retrofitting being just as straightforward. Even more: by allowing for a flexible positioning within the sanitary area the C1 frees up lots of space – and gives more room for the ideation of new concepts in the construction of camping vehicles.
